

Triacton[®]

Bone and digestive health support

Triacton is a triple-action supplement designed to improve bone density and support digestive health in horses. The pelleted supplement contains an array of highly bioavailable minerals and vitamins essential for sound skeletal development and maintenance, as well as optimal function of the gastrointestinal tract.

Studies conducted at Kentucky Equine Research have demonstrated the positive effects Triacton has on bone density and buffering capacity of the stomach and hindgut. See the other side of this sheet for more information about these studies.

Features and Benefits

- Contains a novel source of calcium, shown to be more highly digestible than other forms of the mineral, including calcium carbonate
- Includes an array of other bone-building nutrients, including magnesium, boron, silicone, iodine, zinc, and manganese, as well as vitamins A, C, D, and K, which are important for bone health
- Provides a research-proven stomach buffer, which reduces acidity and decreases the likelihood of gastric ulcer formation
- Supports the beneficial microorganism population of the cecum and colon by minimizing the acidity of the hindgut
- Includes yeast for further hindgut support and improved fiber digestion
- Supplies chelated minerals for optimal absorption.
- Helps increase bone density in young, growing horses and athletic horses, which is especially important for horses involved in intense training such as racehorses, three-day-event horses, polo ponies, and other horses required to work at speed
- Delivers a highly digestible source of minerals and vitamins in an easy-to-feed pellet.

Feeding Recommendations

Feed 120 g per day to mature horses, and 60–120 g to growing horses.

Guaranteed Analysis

Nutrient		per 120g
Crude Protein (min)	14.0%	16.0 g
Crude Fat (min)	3.0%	3.6 g
Crude Fiber (max)	4.0%	4.8 g
Calcium (max)	13.0%	15.6 g
Calcium (min)	12.0%	14.4 g
Phosphorus (min)	2.55%	3.0 g
Magnesium (min)	4.0%	4.8 g
Copper (min)	335 ppm	40.0 mg
Manganese (min)	545 ppm	65.0 mg
Zinc (min)	685 ppm	82.0 mg
Vitamin A (min)	14755 IU/lb	3900 IU
Vitamin D (min)	11000 IU/lb	2900 IU
Vitamin C (min)	3800 mg/lb	1000 mg
Vitamin K (min)	105 mg/lb	27.5 mg

Servings and Container Sizes

Serving size

120 g per day for mature horses.

Container sizes

5kg (41 servings).

12kg (100 servings).

Triacton® Provides Bone and Gastrointestinal Benefits to Horses

Triacton provides three research-proven benefits to horses: increased bone density, improved gastric health, and enhanced hindgut stability.

Bone Density

Studies conducted at Kentucky Equine Research with Triacton demonstrated an increase in bone density among Thoroughbreds in race training. Horses receiving 120 grams per day of Triacton for 90 days had a threefold greater increase in dorsal (shin) cortical bone density compared to the horses that received a placebo (Figure 1).

Digestive Buffer

In order to optimize the health and efficiency of the gastrointestinal tract, the pH of the stomach and hindgut must be controlled. If these environments become too acidic, horses are prone to gastric ulcers and hindgut acidosis. Limestone, known also as calcium carbonate, is commonly used as a source of calcium in equine supplements and fortified feeds. However, this form has a limited capacity to regulate or buffer pH. Triacton contains a different source of calcium and several other highly bioavailable minerals that provide greater buffering capacity than limestone to effectively suppress acidity throughout the digestive tract.

Excessive acidity in the stomach is a primary factor in the development of gastric ulcers in horses. Signs of gastric ulcers include poor appetite, teeth-grinding, dull coat, and changes in disposition. Laboratory studies have shown that when Triacton is added to feed it increases buffering capacity twofold in acidic conditions typically seen in the stomach (Figure 2).

Overproduction of acid in the cecum and colon can lead to hindgut acidosis. This often occurs in horses fed high-grain intakes or fructan-rich forage. Signs of hindgut acidosis include loose or inconsistent manure, chronic colic, and stereotypic behaviors such as wood-chewing and stall-walking. Acute hindgut acidosis can lead to intestinal damage and laminitis. Research has shown that BMC, the calcium source in Triacton, improves the hindgut buffering capacity by 54% (Figure 3).

Triacton supports health in three research-proven ways: increasing bone density for skeletal strength, buffering stomach acid to bolster gastric health and reduce incidence of ulcers, and moderating the pH of the hindgut to prevent acidosis. Triple-action Triacton is a pelleted, palatable supplement designed to be fed twice a day.
